GALAXUS

Controls. Press F1 in flight for this list on screen. Pitch follows a flight stick: pull back (or press Down) to raise the nose. Both can be inverted in Settings.

FLYING

Action	Keyboard and mouse	Gamepad
Pitch and yaw	Mouse, ↑ ↓ ← →	Left stick
Yaw	A D	Left stick
Roll	Q E	Bumpers, right stick sideways
Throttle up and down	W S	Right stick up and down
Zero throttle	X	Right stick click
Thrusters up, down, left, right	R F Z C	
Flight assist on or off	G	B
Chase or cockpit camera	V	Y

IN A FIGHT

Power pips. Six pips are shared between engines, shields and weapons. Pressing a system's key moves a pip to it, taking half from each of the others.

Lead indicator. The red diamond near your target shows where to aim so your shots arrive where it will be.

Aim assist. When your target's lead point is within a few degrees of the nose, your guns swing to it.

Missiles. Keep your target near the nose and a ring closes in on it; when it turns solid red and reads LOCKED, fire. Fighters carry six, restocked when you dock. When one is coming for you, turn hard across its path.

Difficulty. Easy, Normal or Hard, in Settings. Practise in the dogfight simulator under New game.

FIGHTING AND POWER

Action	Keyboard and mouse	Gamepad
Fire	Space, left click	Right trigger
Fire a missile (once locked)	B, right click	Left trigger
Afterburner	H	
Next target or rock	T	A
Scan, hail	K Y	
Match target speed	Tab	
Power to engines	1	D-pad up
Power to shields	2	D-pad left
Power to weapons	3	D-pad right
Balance power	4	D-pad down

STATIONS, MAP AND MENUS

Action	Keyboard and mouse	Gamepad
Dock (close and slow) or undock	Enter	X
Galaxy map	M	Start
System map: destination	N	View / Share
Autopilot	J	Left stick click
System map: find your ship	C	
Speed time up, slow it down	. ,	
Follow your next job	L	
Map: zoom and pan	Scroll wheel, right-drag	
Pause menu: save, load, settings	Esc	
Controls on screen	F1	
Quit	F10	

HOW IT HANDLES

Flight assist on holds the speed you set with the throttle and keeps the ship travelling where the nose points. **Off**, the drives just push and you drift until you counter-thrust.

Turn tightest at lower speed. Your pilot can only take so much g, so turn rate falls as speed rises. The HUD shows the best turning speed.

Mouse flying. The mouse moves a dot in a ring: the further out, the harder you turn.

Collisions. Stations and rocks are solid: ram them and you take damage. Fly into a planet or star and you lose the ship.

Landing. Make a surface port (amber on the system map) your destination and use the autopilot. Come down on the pad below 25 m/s and press Enter. Come down fast anywhere and you crash.

Docking. Fly within 500 m of the station below 80 m/s, then press Enter. The game saves automatically each time you dock.

Getting around. Jump drive between systems, thrusters to fly, autopilot (J) to cross a system: it flies to your job, the station or what you pick on the system map, and stops a few km short. Steer to take over.

Time. Speed time up to 20 times on the autopilot. It drops back to normal in a fight, near a dock, low over the ground, or on arrival.

Gravity. Worlds pull according to their mass. Flight assist holds you up like any other drift; turn it off and you fall.

Jobs. The job you're following shows top right with your next step. It's ringed on the galaxy map and marked on the system map. L switches job; the galaxy map lists them all.

Travel. Pick a system on the galaxy map and jump. Any star inside the green ring is in range.

Mining and scanning. Autopilot to a belt, target a rock (T), scan it (K), and hold fire with a mining laser fitted. K also scans ships and worlds; finds go in the station's Logbook.
